

## Sleeve-All® Sleeve Anchor

Sleeve-All expanding anchors are pre-assembled, expanding sleeve anchors for use in all types of solid base materials. This anchor is available in acorn, hex, rod coupler, flat or round head style for a wide range of applications.

**Codes:** Factory Mutual 3017082, 3026805 and 3029959 ( $\frac{3}{8}$ " –  $\frac{1}{2}$ " diameter); Underwriters Laboratories File Ex3605 ( $\frac{3}{8}$ " –  $\frac{3}{4}$ " diameter); Multiple DOT listings; meets the requirements of Federal Specification A-A-1922A

**Material:** Carbon steel or stainless steel

**Coating:** Carbon steel anchors are zinc plated

## Installation

1. Drill a hole in the base material using a carbide drill bit the same diameter as the nominal diameter of the anchor to be installed.
2. Drill the hole to the specified embedment depth, and blow it clean using compressed air. (Overhead installations need not be blown clean.) Alternatively, drill the hole deep enough to accommodate embedment depth and the dust from drilling.
3. Place the anchor in the fixture, and drive it into the hole until the washer and nut are tight against the fixture.
4. Tighten to required installation torque.

**Caution:** Oversized holes will make it difficult to set the anchor and will reduce the anchor's load capacity.

## Installation Sequence

3/8" diameter anchor data for CIP and CMU is bubbled for convenience

- The tabulated allowable loads are based on a safety factor of 4.0.
- Allowable loads may not be increased for short-term loading due to wind or seismic forces.
- Refer to allowable load-adjustment factors for spacing and edge distance on p. 140.
- Drill bit diameter used in base material corresponds to nominal anchor diameter.
- Allowable tension loads may be linearly interpolated between concrete strengths listed.
- The minimum concrete thickness is 1 1/2 times the embedment depth.

- The tabulated allowable loads are based on a safety factor of 5.0.
- Listed loads may be applied to installations through a face shell with the following placement guidelines:
  - Minimum 3" from vertical mortar joint.
  - Minimum 1" from vertical cell centerline.
- Values for 6"- and 8"-wide concrete masonry units (CMU) with a minimum specified compressive strength of masonry,  $f_m$ , at 28 days is 1,500 psi.
- Embedment depth is measured from the outside face of the concrete masonry unit.
- Drill bit diameter used in base material corresponds to nominal anchor diameter.

**Face Shell Installation**  
Allowable anchor placement in grout-filled CMU shown by shaded areas.

## Allowable Load-Adjustment Factors for Sleeve-All Anchors in Normal-Weight Concrete: Edge Distance and Spacing, Tension and Shear Loads

### How to use these charts:

- The following tables are for reduced edge distance and spacing.
- Locate the anchor size to be used for either a tension and/or shear load application.
- Locate the edge distance ( $c_{act}$ ) or spacing ( $s_{act}$ ) at which the anchor is to be installed.
- The load adjustment factor ( $f_c$  or  $f_s$ ) is the intersection of the row and column.
- Multiply the allowable load by the applicable load adjustment factor.
- Reduction factors for multiple edges or spacing are multiplied together.
